Witle Retail Online- Database Structure

Minse Kim

Witle Online Retail shop is a fictional online retail company that sells electronics, clothing, and home appliances.

Customer entity:
- In order to purchase, a customer must register themselves (name, phone number, email which must be unique for each customer, date of registration)

Customer Address entity:
- Each customer must also register their address, but may have more than one.
- Each address_id (PK) contains the address and a customer_id (FK) that can be linked to its customer entity.
- Whenever an order is placed, the customer may select one of their registered addresses.

Order entity:
- A customer may make as many orders as they wish
- customer_id as FK
- Other details included, such as date of order, order status, and the total amount.

Product entity:
- Each product has a name, description, price, and stock quantity.
- Each product has one supplier, hence a supplier entity is created. Each supplier may have multiple products.
- Each product has one category label, hence a category entity is created. Each category may have multiple products.

Ordered item entity:
- Each order may contain different products.
- Each product may be placed in different orders.
- This creates a many-to-many relationship between the Order entity & Product entity.
- Therefore, another entity, Ordered Item, is created.
- This 3rd entity represents a pair of order_id and product_id.
- This also allows for storing unit price of the product as well as the quantity of each product sold in a specific order.

Delivery entity:
- Delivery information is contained - date of delivery, delivery status, courier name, tracking number.
- It contains a FK address_id. Each customer's address may be used multiple times for delivery, so it's an one-to-many relationship.
- It contains a FK order_id as a delivery must be linked to an order. Each order may have one delivery, and each delivery must also only come from one order. Therefore, they have an one-to-one relationship. Therefore, the FK order_id must be recorded as a unique key in order to prevent more than one order_id being recorded in the delivery entity.

Payment entity:
- A customer may only make one payment per order
- Likewise, each payment must only be linked to one order
- Therefore, the entities order and payment have one-to-one relationship. A FK order_id under Payment entity is recorded as a unique key to prevent duplicates.
- Other information stored include payment date, payment method, payment status, amount paid.
